

INTERNATIONAL TRAINING OFFER

ENSV-FVI (2023-2024)

▶ E-CERISE (Online – Continuing Education for Veterinarian Services)

E-CERISE is an e-learning course for official veterinarians, granting an inter veterinary school diploma. Based directly on WOAHS standards and recommendations, the course is made up of 10 mandatory modules; each module is available online for a period of 3 weeks. In parallel to the online modules, students develop, under the supervision of a designated tutor, a personal project linked to their country's WOAHS PVS Pathway report, which gives rise to an oral presentation during the residential session in France at the end of the course.

- All modules are available independently "à la carte"
- Module 1: Discover the World Organisation for Animal Health (WOAH) is offered free of charge in addition to each module "à la carte"

▶ INDEPENDENT MODULES

We offer the possibility of exploring several topical subjects with independent online modules developed by international experts. The format consists of a day and a half of teaching. These modules give participants the chance to acquire knowledge in specific subjects such as antimicrobial resistance, food safety, crisis management or the One Health approach. Each online training course is available for a period of 3 weeks and is completed by a webinar.

▶ RESIDENTIAL COURSES

Residential courses are face-to-face thematic training courses in the veterinary domain. Based directly on WOAHS standards and recommendations, residential courses are aimed at both official veterinarians (senior veterinary officials, heads of veterinary establishments or agricultural organisations, etc.) and managers from the private sector (animal production, pharmaceutical and agro-industry). Built on a "One Health" approach, courses provide participants with a wide range of general and technical knowledge on global issues and topical subjects such as animal health crisis management, antibiotic resistance, health surveillance and epizootic prevention. Participants will benefit from study trips to Paris, Brussels or Geneva, as well as field trips to engage with real-life case studies.

▶ MASTER ONE HEALTH

The Master One Health: Managing Health of Populations covers a broad range of One Health topics, and calls for interdisciplinary and intersectoral action in the management of public health problems. This face-to-face training course includes a common core curriculum and two specialisation options in risk assessment and risk management. The course is targeted both at students and at working professionals (official veterinarians, physicians, health managers, economists...). Career opportunities include all types of health professionals involved in risk assessment or risk management.

▶ TRAINING ON DEMAND IS ALSO POSSIBLE
